CCDC Inject

INJECT NAME	Evaluate External Perimeter
INJECT ID	EVAL01A

INJECT DESCRIPTION:
Evaluate the external perimeter of the organization's network for available services. Use a tool to identify the services being presented to the external network. Use this information to inform the firewall's security policies, so that only needed services (those that are to be scored) are available. Do this only on the virtual POD where there is an external workstation to accomplish this.

INJECT DELIVERABLE
Respond with a business memo that documents the tool used, what services were found. Consider documenting your results in a clearly readable table.
